                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 179, Application US/09620412C

Patent No. 6448234

GENERAL INFORMATION:
APPLICANT: Steven P. Fling

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR TREATMENT AND
TITLE OF INVENTION: DIAGNOSIS OF CHLAMYDIAL INFECTION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 179, Application US/09598419
Fatent No. 656556

10-SEP-1997 (first entry)

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid modelic acid; (2) a host cell containing the vector; (3) an isolated prolypeptide acid; (2) a nost cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for that has an activity against a biological pathway required for proliferation, or that inhibits or proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, settivity; (11) a culture comprising strains in which the gene or which has a proliferation or the parent or which has a proliferation or the product or which has the remaining the extent or which hash of the strains in which the gene or which has a proliferation or the pane or the product or a gene or which has a proliferation or the product or a gene or which has a proliferation or the pane or th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fits.inpo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proceins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or scre

Corn starch branching enzyme IIb (SBEIIb) (AAW19212) is an isoform of starch branching enzyme that shows higher rates of branching with amylopectin rather than amylose as subscrate. A cDNA inser (AAF69229) in plasmid clone pBR240 that expresses SBEIIb has been used as a starting point in the assembly of DNA constructs (see also AAF69730, AAF69736-37) designed to achieve suppression of SBEIIb expression in transgenic corn plants, and thereby to produce novel starches that have properties beneficial in food and industrial applications
                                                                                                        Starch branching enzyme IIb, SBEIIb; corn; maize; antisense; amylopectin; transgenic plant, pBE240.
                                                                                                                                                                                                                                                                                                                                                                                                                      Transgenic corn in which grain derived starch fine structure is controlled - specifically branch chain distribution of amylopectin, useful in preparation of thickened foodstuff.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Page 50-53; 92pp; English.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidase, therapeutics and pharmaceutical fruge. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-BABT2017). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bifidobacterium longum NCC2705; Bifidobacterium; bacterial; antidiarrheic; antibacterial; inhibitor of Salmonella; detection; identification; lactic acid bacterium; diarrhoea; pathogenic bacteria;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bifidobacterium longum NCC2705 ORF amino acid sequence SEQ ID NO:732.

The present invention describes a polymucleotide (I) comprising a sequence of a Bifidobacterium genome selected from the nucleotide sequences given in ABGB1842 and ABGP1843, or a sequence exhibiting at least 90% identity or which hybridises with the sequence exhibiting at Last 19% identity or which hybridises with the sequence given in ABGB1842 and ABGB1843. Also described is a polymucleotide (II) encoding a cut of the protein comprising a sequence selected from 1097 sequences given in ABGE528 to ABGE6354 ligated in frame to a polymucleotide encoding a cut of the properties, and can be used as an inhibitor of Salmonella. (I) (which is a probe) is useful for the detection and/or identification of Bifidobacterium longum in a biological sample. A carrier containing the sactio acid bacterium Bifidobacterium longum NCC2705 (CNCM I-2618) can be used for preventing and/or treating diarrhoea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition selected from tablets, liquid bacterial lased products, milk based fermented products, ince-creams, fermented cereal based products, ince-creams, fermented cereal based products, ince-creams, fermented cereal based products, milk based composition selected from tablets, liquid bacterial suspensions, dried oral supplement, wet cube feeding or wet tube feeding.

(I) is useful in DNA arrays or chips to carry out analysis of the stindard contains gene. ABGE81850 represent or selected.
                                                                                                                                                                                                                                                                                                                                  Novel polynucleotide comprising Bifidobacterium genome sequence useful as a probe or primer for detecting and/or identifying Bifidobacterium longum in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bifidobacterium related nucleotide sequences given in the Sequence Listing from the present invention but not mentioned further within the specification. N.B. The sequence data for this patent is not represented in the printed specification but is based on sequence information.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .,

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGK) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). (II) the polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed cartivity of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in the protein protein acceptance in the protein protein and polymucleotide sequences have applications in the protein protein and polymeric diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fits. Fig. Wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic matent did not ameas of the invention. Note: The sequence other this partner are the sequence of the nivention. Note: The sequence of the invention but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                         Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;

New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

Example 1; SEQ ID NO 20436; 1481pp; English

The invention relates to an isolated polymucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polymetrides encoded by the polymucleotides (ABMS5624-ABM64536) and to immunogenic fragments of P. acnes polymetrides. The invention additionally encompasses expression vectors and host cells comprising a polymucleotide of the invention, antibodies against polymetrides of the invention, a method for stimulating an immune response specific for a P. acnes polymetride and an isolated T cell population comprising T cells prepared to the invention, a method for stimulating an immune response specific for a P. acnes polymetrides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polymetride); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polymetrides, polymucleotides, antibodies, fusion proteins, proteins T cell populations or antigen-presenting express the proteins T cell populations or antigen-presenting express the express the proteins T cell populations or antigen-presenting express the express the proteins T cell populations or antigen-presenting express the express the expressive proteins are express the expressive presenting or antigen-presenting expressive presenting cells that express the expressive presenting or antigen-presenting expressive presenting or antigen-presenting expressive presenting or antigen-presenting or antigen-presenting or antigen-presenting expressive presenting or antigen-presenting or antigen-presentin and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acres polynucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences polypeptides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. The polynucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present

The invention relates to a novel purified preparation of a human antibody, which binds to a tissue inhibitor of metalloprotease-1 (TIMP-1) and neutralises a matrix metalloprotease (MMP) inhibiting activity of TMP and neutralises a variable heavy chain (VHC)DR3 region and a variable light chain (VLC)DR3 region. An antibody preparation of the invention has hepatotropic, cytostatic, nephrotropic and cardiant activity. The human antibody is useful for decreasing an MMP-inhibiting activity of a TIMP-1. It is especially useful for ameliorating the symptoms of a disorder in which TiMP-1 is elevated, e.g. liver fibrosis, alcoholic liver disease, cardiac fibrosis, acute coronary syndrome, lupus nephritis, glomerulosclerotic renal disease, idiopathic pulmonary fibrosis, benign prostate hypertrophy, lung cancer or colon cancer. The antibody is also useful for detecting a TIMP-1 in a test preparation, or in diagnosing a disorder in which a TIMP-1 level is elevated. The sequences shown in ABR01460-ABR01501 represent the light chain regions of a human anti-TIMP-1 antibody of the invention Sequence 214 AA;

New human anti-TIMP-1 (tissue inhibitor of metalloprotease-1) antibodies, for diagnosing or ameliorating the symptoms of a disorder in which TIMP-1 is elevated, e.g. liver fibrosis, benign prostate hypertrophy or lung

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypercosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies polypeptides may be used as antigens in the production of antibodies of therefore treat P. acnes proteins. The antibodies and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for the printed in electronic format directly from NIPO at

ö
and the anti-CCP antibody are useful in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle due to derviscommental conditions, including ablotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or bictic stress such as pathogen attack, to modulate e.g. enhance crop yields, and attenuate plant architecture, plant quality traits, plant reproduction and seed development, endoreduplication in storage cells, storage tissues and/or storage organs of plants or its parts. CCP is useful as an immunogen to generate antibodies. CCP protein is useful to screen for naturally cocurring CCP substrates. The polynuclectide is useful for expressing CCP protein, to detect CCP mRNN, or a genetic lesion in a CCP gene and to modulate CCP activity. The present sequence represents a CCP protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New plant transcription factor polynucleotides and polypeptides, useful in producing transgenic plants with commercially valuable properties, such as an alteration in a plant growth characteristic, e.g. growth rate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a number of isolated Arabidopsis thaliana cDNA sequences and their encoded proteins which are especially transcription factor related cDNA's and proteins. The isolated or recombinant plant transcription factor polynucleotides and polypeptides are useful in producing transgenic plants with commercially valuable properties, i.e. modified or altered desirable traits as compared to a reference plant,

such as an alteration in a plant growth characteristic, e.g. growth rate,
                                                                                                                                                                                                                                                                                                                          Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
        germination rate of seeds, vigor of plants and seedlings, or leaf and flower senescence. Sequence information related to the polymucleotides and also be used in boinformatic search methods. The transgenic plant is useful for growing a progeny plant from a parent plant. This sequence represents one of the proteins of the invention.
                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                    12-0CT-1999
                                                                                                                                                                                                          25-AUG-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21-OCT-1999
```

```
The invention relates to a novel cell cycle protein (CCP) and the polynucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP antibody is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, maize, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CCP nucleic acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat cisorders characterised by insufficient or excessive production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP protein forms which have decreased or collypeptide are useful for modifying cell face, plant development, compounds that plants, initiation, seed set, seed size, seed development, tuber, fruit, leaf formation, shoot and root initiation and/or development, noters: CCP, the polynucleotide
                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cell cycle protein; CCP; cell cycle regulation; herbicide; plant growth regulator; plant development; abiotic stress; biotic stress; nutrient deprivation; pathogen attack; crop yield; immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators.
                                                                                                                                                                                 Gaps

involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to novel human diagnostic and therapeutic

polymucleotides designated dithp (ACC46080-ACC46749) and to their encoded

polymucleotide sequences at least 90% identical to the dithp cDNA

comparison (DITHP) ABRA1136-ABRA1812). The invention also relates to

polymucleotide sequences at least 90% identical to the dithp cDNA

comparison of DITHP proteins, not cells and

crecombinant production of DITHP proteins; antibodies specific for DITHP

proteins microarrays comprising dithp nucleic acid sequences; methods of

corceins microarrays comprising the nucleic acid sequences; methods of

corceins dithp nucleotide and protein sequences; methods of

casessing the toxicity of test compounds using a dithp hybridisation

corpose. Dithp nucleic acid sequences and DITHP proteins may be used in the

diagnosis of a wide variety of conditions including cancer and other cell

corposes of a wide variety of conditions including cancer and other cell

corposes of a wide variety of conditions including cancers; metabolic

corposes of a wide variety of conditions including cancer and other cell

corposes of a wide variety of conditions including cancer in the connective tissue disorders; metabolic

disorders; neurological disorders; gastrointestinal disorders; transport

corposes and connective tissue disorders. They may also be used to

sorceen for modulators of protein acitivity or gene expression. DITHP

corposeders and to induce antibodies. The dithp nucleic acids are

additionally useful in somatic or germline gene therapy of the disorders in

corposeders and to induce antibodies. The dithp nucleic acids are

controlled above, as a source of antisense sequences, as a source of

the general or protein and additionally and identification of individuals, in

the formal of the protein and the protein and the disorders in the connection and and the protein of the protein and the protein of the protein of the protein of the protein of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the generation of transgenic animal models of human disease or knock in humanised animals, in toxicological testing, and in transcript imaging. The present sequence represents a DITHP protein which has intracellular signalling activity. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                     à
                                                                                                                                                                  g
                                                                                                                                                                                                                                   ö
                                                                                                                                          The present sequence is a herpes simplex virus (HSV) truncated tegument protein VP22 derived peptide. VP22 was used in the preparation of a novel mativital agent, which inhibits the maturation and/or replication of HSV by disrupting association between VP22 and VP16 and/or gB. The agent can be used to treat, e.g. cold sores, genital herpes, chickenpox and

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         in danostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders
New antiviral agent disrupting binding of VP22 to VP16 or gB - useful for treating infections caused by herpes simplex, e.g. cold sores and chicken
                                                                                                                                                                                               The present sequence is the herpes simplex virus (HSV) truncated tegument
                                                                                                                                                                                                                                                                                             рę
                                                                                                                                                                                                                          protein VP22. VP22 was used in the preparation of a novel antiviral agent, which inhibits the maturation and/or replication of HSV by disrupting association between VP22 and VP16 and/or gB. The agent can be used to treat, e.g. cold sores, genital herpes, chickenpox and shingles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polymucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a peptide which was used to form a linker between chimaeric proteins consisting partially of the hepatitis C virus core protein. The core protein has been shown to be localised to lipid droplete within cells. This means that fragments of the protein, in particular those comprising amino acids 125-144 or 161-166, can be used to target proteins to lipid droplets in milk. This provides a simple and efficient means of obtaining proteins of interest, using transgenic animals. Proteins of interest include those implicated in disease and antigenic polypeptides for use as vaccines

This sequence represents a novel method for stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to an antigen (I). The method comprises (i) dividing the amino acid sequence of the antigen into protein fragments (II) of at least 9 amino acids, whereby adjacent or neighbouring fragments are in the whole antigen sequence; (ii) synthesizing a peptide library containing (II); and (III); and (III) in a single culture vessel. The method is used to immunocery expiniting (II) in a single culture vessel. The method is used to immunocery expinitate T cells of mammals, particularly humans, and is also useful for diagnostic purposes to determine if a mammal, especially human, has previously immunologically responded to a specific protein, and to determine strength of that response. The method is suitable for in vivo or in vitro immuno-stimulation of mammalian, more preferably human T lymphocytes, where the stimulated T lymphocytes are expanded and can be transfused into a partient. ARB86614-ARB8603 represent fragments of the human cycomegalovirus IE1 and pp65 lower matrix phosphoprotein which are used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HSV; tegument protein; VP22; UL49; antiviral agent; treatment; cold sore; genital herpes; chickenpox; shingles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to the antigen comprises using a synthetic peptide library of the specific antigen.
Antigen-specific stimulation, T-lymphocyte, CD8 stimulation, pp65; CD4 stimulation; immuno-stimulation; IE1; lower matrix phosphoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                         a channel activating processes 1 (CAPI is a serine processe and there is no native expression of endogenous CAPI is a serine processe and there is no native expression of endogenous CAPI gene. Transgenic mice which a terrologous disruption in the CAPI gene exhibit an increased susceptibility to seizures which are similar to epilepsy. Disclosed is a method for producing the transgenic mouse with a disruption in the CAPI gene which contains a targeting construct comprising a first or second portion; respectively, of the CAPI gene and a selectable marker. Also disclosed are methods for identifying an agent that modulates susceptibility to esizure or the phenotype, for identifying a potential therapeutic agent correating epilepsy, for evaluating a potential therapeutic agent capable of affecting a condition associated with a mutation in a CAPI gene (e.g. a CAPI agonist) and for determining whether an agent modulates a CAPI serine protease. The transgenic mouse, comprising a disruption in a CAPI gene, is useful for preparing a pharmaceutical composition for treating epilepsy. The sequence presented is the mouse CAPI protein

The Eimeria acervulina 200 kD antigen, recombinant vector viruses or host cells are used to produce vaccines to protect avians against coccidiosis particularly chickens. The vaccine can also contain immunogens related to other pathogens found in poultry or may contain nucleic acid encoding them e.g. antigens of Marek's Disease virus, Newcastle Disease virus, Chicken for Infectious Bronchitis virus, Infectious Bursal Disease virus, Chicken Anaemia Agent, Reo virus, Avian Retro virus, Fowl Adeno virus, Turkey Rhinotrachetits virus, E. Coli or other Eimeria species to produce a multivalent vaccine. The nucleic acids are useful as hybridisation probes to isolate sequences encoding functional variant proteins e.g. from clissues or a cDNA library from a specific Eimeria strain. The nucleic acid is additionally used in test kits for diagnosis of Eimeria Cc infections and infunuoassays. (Updated on 25-WAR-2003 to correct PF field.) The invention relates to a novel isolated peptide comprising one or more cytotoxic T-lymphocyte (CTL) epitope(s) of the same or different antigen of a human cytomegalovirus (HCMV). The HCMV antigens can comprise pp28, pp50, pp65, pp71, pp150, gB, gH, IE-1, IE-2, IG2, US2, US3, US6, US11 or UL18. The peptide comprises a sequence of about 9-20 contiguous amino acids of treating cytomegalovirus infection in humans, and in monitoring immune responses in various clinical settings (e.g. transplantation or pregnancy). This sequence represents a human cytomegalovirus CTL epitope peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mouse, enzyme; transgenic; channel activating protease 1; CAP1; serine protease; seizure; epilepsy; therapeutic; agonist; anticonvulsant.
                                                                                                                                                                                                                                                                                         for diagnosing, preventing or treating CMV infection, comprises pp28, pp50, pp65, pp71, pp150, gB, gH, IE-1, IE-2, US2, US3, US6, US11 or UL18.
                                                                                                                                                                                                                                                                         New human cytomegalovirus (CMV) cytotoxic T-cell epitope peptide, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             77.4%; Score 41; DB 6; Length 9;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABG72018
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are proteins from Photorhabdus luminescens. The isolated sequences are generated so fprobes and primers for detecting the genome of P. luminescens and related species, to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the colympetides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that can mals or microcorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. combinant production of the proteins, particularly toxins and creaminated to express the genes are useful for recombinant production of the proteins, particularly toxins and creaminated to protein that are sensitive to P. luminescens encoded toxins or antibiotics) and as compensationes. Other uses of the genes and Ab are also useful care sensitive to P. luminescens-encoded toxins or antibiotics) and as compensationes. Other uses of the genes and the proteria are sa virulence factors and for identifying targets of human diseases for which P. C. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Virucide; immunostimulant; cytotoxic T-lymphocyte; CTL; epitope; antigen; human cytomegalovirus; HCMV; pp28; pp50; pp65; pp71; pp150; gB; gH; IE-1; IE-2; US2; US3; US6; US11; UL18; cytomegalovirus infection; pregnancy;

                                                             ABG79900
```

```
The invention relates to a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal comprising administering directly to the lymphatic system of the mammal:

(a) an antigen in the form of a polypeptide; (b) a vector comprising a nucleic acid encoding the antigen; or (c) a non-peptide antigen. The method is useful for inducing and/or sustaining CTL response in a mammal. This is particularly useful for treating a mammal having a malignant tumour (e.g. carcinoma, melanoma, leukaemia or lymphoma) or infectious disease (e.g. heptilis, acquired immune deficiency syndrome (AIDS), malaria, measles or tuberculosis), or in an animal having a predisposition to these diseases. The mammal may be dogs, cats, mice, actile, sheep, pigs, goats, rabbits, or preferably humans. ABG79753-ABG80119 represent viral epitopes on major histocompatibility complex (MHC) class I molecules, used in the method of the invention
```

o;

Gaps ;

The invention relates to a novel isolated peptide comprising one or more cytotoxic T-lymphocyte (CTL) epitope(s) of the same or different antigen of a human cytomegalovirus (HCMV). The HCMV antigens can comprise pp28, pp50, pp55, pp71, pp150, pg 94, IE-1, IE-1, IE-2, US2, US3, US6, US11 or UL18. The peptide comprises a sequence of about 9-20 contiguous amino acids of the antigen. The peptide epitopes are useful in diagnosing, preventing or treating cytomegalovirus infection in humans, and in monitoring immune responses in various clinical settings (e.g. transplantation or pregnancy). This sequence represents a human cytomegalovirus CTL epitope peptide of the invention

Sequence 11 AA;

New human cytomegalovirus (CMV) cytotoxic T-cell epitope peptide, useful for diagnosing, preventing or treating CMV infection, comprises pp28, pp50, pp65, pp71, pp150, gB, gH, IE-1, IE-2, US2, US3, US6, US11 or UL18.

The invention relates to immunologically active peptides, and functional variants thereof. Capable of eliciting a cellular immune response to dimman cytomegalovirus (HCMV) in humans. The peptides are capable of directing human cytotoxic T lymphocytes (CTL) to recognise and lyse human cells infected with HCMV. Such immunologically active peptides, in molecule, are recognised by CTLs of individuals having a latent (inactive) HCMV infection. Vaccines comprising these peptides are useful for activating CTLs and CTL precursors (CTLp), particularly for eliciting a cellular immune response against HCMV by normal and immunodeficient subjects. The peptides may be used in an assay for determining the degree of immunostimulation caused by HCMV. The peptides may also be used in an assay for determining the degree of immunostimulation caused by HCMV. The peptides may also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        distinguishing individuals who are seropositive from those who have not been exposed to HCMV (seronegative individuals). The present peptide sequence is a cytotoxic epitope variant from human cytomegalovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptides that are immunogenic epitopes of the human cytomegalovirus (CMV), useful for activating cytotoxic T lymphocytes (CTL) or CTL precursors to elicit an immune response against human CMV by normal or immunodeficient subjects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human cytomegalovirus, HCMV, cytotoxic epitope, infection, vaccine, cytotoxic T lymphocyte, CTL, CTL precursor; CTLp, Class I antigen, emajor histocompatibility Compis. The invention relates to immunogenic peptides derived from human cytomegalovirus (HCMV) which are recognised by human cytotoxic T lymphocytes (CTL). The invention also discloses a vaccine against HCMV comprising one of the peptides, and a pharmaceutically acceptable carrier, a cellular vaccine against HCMV comprising antigen presenting cells that have been treated in vitro so that they express the peptide, and a recombinant viral vector vaccine sypressing a gene encoding the peptide. The vaccine is used to modulate the immune response to human cytomegalovirus infection. HCMV is implicated in a number of diseases and conditions including restenosis after coronary angioplasty, morbidity/mortality in AIDS (acquired immunodeficiency syndrome) patients, viral retinitis leading to blindness, encephalitis, enterities, morbidity/mortality in AIDS (acquired immunodeficiency syndrome) patients, viral retinitis leading to blindness, encephalitis, enterities, ascroma) and post-bone marrow transplant complications. The present sequence is an HCMV pp65 based immunogenic epitope peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New immunogenic peptides useful as a vaccination against cytomegalovirus infection, comprises epitopes of human cytomegalovirus which are recognized by human cytotoxic T-lymphocytes.
                                                                                                                                                                                                                                                                                    Immunogenic epitope, pp65; cytotoxic T cell; CTL; HCMV; vaccine; virucide; restenosis; coronary angioplasty; morbidity; mortality; AIDS; acquired immunodeficiency syndrome; viral retinitis; blindness; encephalitis; enteritis; mononucleosis; interstitial pneumonia; malignancy; Karposi's sarcoma; post-bone marrow transplant complication.
                                                                                                                                                                                                                                                   Human cytomegalovirus pp65 protein based immunogenic epitope #4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    90.6%; Score 48; DB 5; Length 10; 100.0%; Pred. The present invention describes immunologically active peptides (IAPS) capable of eliciting a cellular immune response to human cytomegalovirus (hCMV). The IAP can be used in a (cellular) vaccine to augment the immune system response to HCMV, or to provide immunity against HCMV. The IAP (cellular) vaccine can also protect an individual having a latent HCMV infection from reactivation. An antigen presenting cell can be used to determine the presence or absence of HCMV-infected Ilymphocytes. The viral vector containing IAP encoding DNA can also be used to provide immunity against HCMV. The IAP can be used to prepare HCMV-reactive human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytocoxic T lymphocytes. The antigen presenting cells primed with the IAPB can be used as diagnostic reagents to detect immunostimulation by HCMV. They can also detect active HCMV infection or exposure to HCMV. HCMV can cause opportunistic infections resulting in a variety of complications in, e.g. immunosuppressed patients. The IAP vaccines impart immunity to bone marrow transplant recipients, solid organ recipients, heart patients, AIDS patients or women of child-bearing years, without the need for ex vivo expansion of HCMV-specific cytocoxic T lymphocytes (which requires sophisticated laboratory setup and is highly labor-

stimulate T cells of mammals, particularly humans, and is also useful for diagnostic purposes to determine if a mammal, especially human, has previously immunologically responded to a specific protein, and to determine strength of that response. The method is suitable for in vivo or in vitro immuno-stimulated mammalian, more preferably human T lymphocytes, where the stimulation of mammalian, more preferably human T ransfused into a patient. AAB86544-AAB86803 represent fragments of the human cytomegalovirus IBI and pp65 lower matrix phosphoprotein which are used to illustrate the method of the invention

Combined antigen containing parts of 3 human cytomegalovirus proteins useful for early detection of virus specific antibodies and in

Example 4; Page 21; 26pp; English.

preventative vaccines.

The present sequence represents a human cytomegalovirus combined antigen, which contains amino acid sequences from at least 3 human cytomegalovirus (hCMV) proteins and has an increased ability to bind hCMV specific antibodies (AB). The device is used to detect and quantify Ab. particularly of immunoglobulin A (IgA) type, in human body fluids and tissues. The antigen is also used in vaccines for protection against combined antigen can detect hCMV infection at an early stage (allowing early treatment), since sensitivity and accuracy are improved by the interaction of immunodominant regions of early formed proteins present in a single antigen (the combine antigen) a binding ability is 2.3 times greater than for single antigens). The combined antigen also avoids the lack of antigen standardisation which limits use of conventional assay systems

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present generic peptide sequence is based on the sequence given in AM48885. Sequence variants of the present peptide are recognised by the CD8+ class I major histocompatibility complex (MHC) restricted cyctocoxic T-1ymphocytes of patients harboring latent HCMV infection. The peptides are claimed to be capable of activating cytocoxic T-cell lymphocytes in the absence of active viral reppication, and thus are useful for eliciting a cellular immune response against HCMV by normal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunodeficient subjects. These immunological peptides can also be formulated as vaccines which are claimed to be useful for protecting against HGMV infection, augmenting the immune system response to a HGMV infection or protecting against reactivation of a latent HGMV infection
                                                                                                                                                                                                                                                                            Generic immuno-reactive peptide CTL epitope 4 of human cytomegalovirus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                          This sequence comprises the full-length human cytomegalovirus (HCWV) Towne strain tegument phosphoprotein pp55; the strain AD169 pp65 sequence is given in AAW26732. The invention provides DNA molecules (see AAF191280-83 and AAT99436) useful for in vitro and in vivo expression of antigenic fragments of the HCMV genome. Preferred antigens include full-length and transmembrane-deleted fragments of gB (see AAW21274) such as gB1-680, phosphoprotein pp65 (see AAW27276) phosphoprotein pp65 (see AAW27277) and the Ir-exon 4 product (see AAW27275). The DNA molecule is preferably in the form of a plasmid and includes a regulatory sequence for expressing the antigen in mammals, where the antigen elicits an immune response. The products can induce HCMV-specific immune responses including neutralising antibodies and cytotoxic I lymphocytes and can be used for the prevention and treatment of HCMV infections
New human cytomegalovirus DNA constructs - encode a HCMV antigen to induce an immune response, used for the treatment and prevention of {\rm HCMV}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytomegalovirus; CMV; pp65 antigen; cytostatic; virucide; cell therapy; vaccine; viral infection; immunotherapy; gene therapy; cancer.

Novel synthetic antigenic compounds useful as components of antiviral vaccines and to expand immune effector cells which are specific for viral infections characterized by expression of cytomegalovirus antigen pp65.

The invention relates to synthetic antigenic compounds which are useful

Claim 7; Page 63-64; 66pp; English.

```
specific for viral infections characterised by expression of COMP.

Cytomegalovirus antigen pp65. Antigenic compounds are useful for immunotherapy and also for inducing an immune response in a subject. The antigenic compound is useful for addilating immune response to the cartification of comparts and their corresponding native proteins, and is useful as compound is useful for modulating immune response to the cognate native ligands and their corresponding native proteins, and is useful as compounds and their corresponding native proteins, and is expanding immune effector cells that are specific for viral infections characterised by expression of CMV antigen pp65. Furthermore, the cartigenic compound also has diagnostic applications. The DNA encoding the antigenic compounds are useful as probes and primers for detecting genes antigenic compounds are useful as probes and primers for detecting genes or gene transduction of the polynuclectides into host cells and also in gene therapy techniques for treating cancer. The antigenic compounds immune receptor cell is also useful as vaccines. The antigenic compounds immune receptor cell for preparing medicaments for diseases such as cancer. The present sequence is native CMV antigen pp65 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cells for the immuno-stimulation of mammals and the determination of the response to an antigen (1). The method comprises (i) dividing the amino acid sequence of the antigen into protein fragments (II) of at least 9 amino acids, whereby adjacent or neighbouring fragments are in the whole antigen sequence; (ii) synthesizing a peptide library containing (II); and (iii) incubating the CDB and/or CD4 T lymphocytes in a suspension comprising (II) in a single culture vessel. The method is used to immuno-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and

The invention relates to a novel isolated peptide comprising one or more cytotoxic T-lymphocyte (CTL) epitope(s) of the same or different antigen of a human cytomegalovirus (HCMV). The HCMV antigens can comprise pp28, pp50, pp65, pp71, pp150, gB, gH, lE-1, lE-2, US2, US3, US6, US11 or UL18. The peptide comprises a sequence of about 9-20 contiguous amino acids of treating cytomegalovirus infection in humans, and in monitoring immune responses in various clinical settings (e.g. transplantation or pregnancy). This sequence represents a human cytomegalovirus CTL epitope peptide of the invention

AD169 strain tegument phosphoprotein pp55; the strain Towne pp65 sequence is given in AAW27276. The invention provides DNA molecules (see AAT91280-83 and AAT99436) useful for in vitro and in vivo expression of antigenic fragments of the HGWV genome. Preferred antigens include full-length and transmembrane-deleted fragments of gB (see AAW27274) such as gB1-680, phosphoprotein pp65 (see AAW27276 and AAW27274) such as gB1-680, (see AAW27277) and the IE-exon 4 product (see AAW27275). The DNA molecule is preferably in the form of a plasmid and includes a regulatory sequence for expressing the antigen in mammals, where the antigen elicits an immune response. The products can induce HGWV-specific immune responses including neutralising antibodies and cytotoxic T lymphocytes and can be used for the prevention and treatment of HGWV infections
                                                                                                                                                                                     New human cytomegalovirus DNA constructs - encode a HCMV antigen to induce an immune response, used for the treatment and prevention of {\rm HCMV}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                   This sequence comprises the full-length human cytomegalovirus (HCMV)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HCMV; CMV; antigen; infection; therapy; vaccine; tegument protein;

This sequence represents a novel method for stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to an antigen (I). The method comprises (i) dividing the amino acid sequence of the antigen into protein fragments (II) of at least 9 amino acids, whereby adjacent or neighbouring fragments are in the whole antigen sequence; (ii) synthesizing a peptide library containing (II); and (iii) incubating the CD8 and/or CD4 T lymphocytes in a suspension comprising (II) in a single culture vessel. The method is used to immunosimulate T cells of mammals, particularly humans, and is also useful for diagnostic purposes to determine if a mammal, especially human, has previously immunologically responded to a specific protein, and to determine strength of that response. The method is suitable for in wive or in vitro immuno-erimination of mammalian.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or in vitro immuno-stimulation of mammalian, more preferably human T lymphocytes, where the stimulated T lymphocytes are expanded and can be transfused into a patient. AAB8654-AAB86803 represent fragments of the human cytomegalovirus IE1 and pp65 lower matrix phosphoprotein which are used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to the antigen comprises using a synthetic peptide library of the specific antigen.
                                                                                                                                                                                                                                                                                                                                                                                 Antigen-specific stimulation; T-lymphocyte; CD8 stimulation; pp65; CD4 stimulation; immuno-stimulation; IE1; lower matrix phosphoprotein.
                                                                                                                                                                                                                                                                                                                                       Human cytomegalovirus strain AD169 pp65 peptide fragment SEQ ID 130.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Khatamzas

This sequence represents a novel method for stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to an antigen (I). The method comprises (i) dividing the amino caid sequence of the antigen into protein fragments (II) of at least 9 caid sequence of the antigen into protein fragments are in the whole antigen sequence; (ii) synthesizing a peptide library containing (II); comprising (II) in a single culture vessel. The method is used to immunocomprising (II) in a single culture vessel. The method is used to immunocomprising (II) in a single culture vessel. The method is used to immunocomply immunologically particularly humans, has diagnostic purposes to determine if a mammal, especially human, has consisted in vitro immuno-stimulation of mammalian, more preferably human T con in vitro immuno-stimulation of mammalian, more preferably human T con in vitro immuno-stimulation of mammalian, more preferably human T con in vitro immuno-stimulation of mammalian, more preferably human T con in vitro immuno-stimulation of mammalian, more preferably human T con in vitro patient. AAB86544AAB86803 represent fragments of the human cytomegalovirus IEI and pp65 lower matrix phosphoprotein which are used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to the antigen comprises using a synthetic peptide library of the specific antigen.
                                                                                                                         Antigen-specific stimulation; T-lymphocyte; CD8 stimulation; pp65; CD4 stimulation; immuno-stimulation; IE1; lower matrix phosphoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

related Kaposi's sarcoma, sarcomas, osteosarcoma, renal carcinoma, and haematopoietic malignant tumours such as leukaemia and lymphoma. The aptitope is an HLA, (human leukocyte antigen) peptide derived from a viral orlumour antigen. The present sequence is a viral HLA epitope used in the fusion proteins of the invention

; 0

```
New polynucleotide capable of expressing an epitope-beta2m fusion protein useful for generating cytotoxic I lymphocyte responses against a tumor and in restoring antigen presentation in the tumor of a host.
sequence is an HCMV pp65 protein immunogenic epitope upon which vaccines and peptides of the invention are based
                                                                                                                                                                                                                                                                                                                                                                                                                                prostatic cancer; testicular cancer; lung cancer; breast cancer; malignant melanoma; mesothelioma; brain tumour; ovarian cancer; uterine cancer; cervical cancer; head and neck cancer; bladder cancer; Kaposi's sarcoma; renal carcinoma; leukaemia; lymphoma; acquired immunodeficiency syndrome; AIDS-related lymphoma.

The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintaining the level of the antigen in the method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of antigen, or a viral antigen. They can be used for the treatment of antigen, as cancer, e.g. malignant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes place in the milieu of the lymphoid organ, and it sustains stimulation the takes place in the milieu of the lymphoid organ, and it sustains stimulation the black of air and the bresent invention

Sequence 15 AA;

The invention relates to a new polynuclectide capable of expressing an epitope-beta 2m fusion protein useful for generating cytotoxic T

Iymphocyte (CTL) responses against a tumour or in restoring antigen presentation in the tumour of a host. Also included are a polynuclectide capable of expressing an epitope-beta 2m fusion protein in combination with a vaccination agent that stimulates a CTL response against the epitope of the fusion protein for simulates a CTL response against the use in the treatment of cancer and a method of treating a tumour by administering a capable of expressing an epitope-beta 2m fusion protein, and optionally a vaccination agent that stimulates a CTL response against the epitope of the fusion protein. The polynucleotide is useful for the epitope of the fusion protein. The polynucleotide is useful for generating CTL responses against tumours, for restoring antigen protein in the tumour, and subsequently for treating cancers, such as gastrointeerinal tumour, protatic, testicular, lung or breast cancer, malignant melanoma, mesotheliona, brain tumour, ovarian cancer, uterine cancer including cervical cancer, cancer of the head and neck, bladder cancer, Kaposi's sarcoma, AIDS (acquired immunodeficiency syndrome)-

The invention relates to immunologically active peptides, and functional variants thereof, capable of eliciting a cellular immune response to thuman cytomegalovorius (HGMV) in humans. The peptides are capable of directing human cytotoxic T lymphocytes (CTL) to recognise and lyse human cells infected with HCMV. Such immunologically active peptides, in association with an major histocompatibility complex (HCC) class I molecule, are recognised by CTLs of individuals having a latent (inactive) HCMV infection. Vaccines comprising these peptides are useful

```

Claim 9; Page 49; 56pp; English.

The present peptide is an immunogenic epitope which is recognised by the CD8+ class I major histocompatibility complex (MHC) restricted cytotoxic T-lymphocytes of patients harboring latent HCMV infection. The peptide is claimed to be capable of activating cytotoxic T-cell lymphocytes in the absence of active viral replication, and thus is useful for eliciting a cellular immune response against HCMV by normal and immunodeficient subjects. The immunological peptide can also be formulated as a vaccine which is claimed to be useful for protecting against HCMV infection, which is claimed to be useful for protecting against HCMV infection, augmenting the immune system response to a HCMV infection or protecting against reactivation of a latent HCMV infection

Immunogenic peptide cytotoxic T lymphocyte epitopes of human cytomegalovirus.

Claim 9; Page 50; 64pp; English.

capable of eliciting a cellular immune response to human cytomegalovirus (hCMV). The IAP can be used in a (cellular) vaccine to augment the immune system response to HCMV, or to provide immunity against HCMV. The IAP cellular vaccine can also protect an individual having a latent HCMV infection from reactivation. An antigen presenting cell can be used to determine the presence or absence of HCMV-infected T lymphocytes. The viral vector containing IAP encoding DNA can also be used to provide present invention describes immunologically active peptides (IAPs)

```
The present invention describes a cellular vaccine (I), which elicits a MHC class I cellular immune response to human cytomegalovirus (HCWV), and comprises a peptide selected from (i) - (v), provided that (i) is not another peptide (vi): (i) Asn Xaal Vall Pro Met Val Ala Thr Xaa2; (ii) Tyr Xaa3 Glu His Pro Thr Phe Ser Gln Tyr; (iii) Phe Xaa4 Phe Pro Lys Asp Val Ala Leu Xaa5; (iv) Thr Pro Arg Val Thr Gly Gly Gly Gly Ala Xaa5; and (v) Phe Pro Thr Lys Asp Val Ala Leu, where: Xaa1 = Leu, Ile, Met, Thr or Val; Xaa2 = Val, Ala, Cys, Ile, Leu or Thr; Xaa3 = Ser, Thr or Leu; Xaa4 = Val or Thr; Xab5 = Leu, Arg or Lys; Xaa6 = Leu, Met or Phe; and (i) is not Asn Leu Val Pro Met Val Ala Thr Val (vi). The peptides are useful is not providing immunity against future infections by HCMV, and for augmenting the immune response of an individual who is latently infected with HCMV
                                                                                                                                                                                                                                                                                                                                      o;
immunity against HCMV. The IAP can be used to prepare HCMV-reactive human cytocoxic T lymphocytes. The antigen presenting cells primed with the IAPs can be used as diagnostic reagents to detect immunostimulation by HCMV. They can also detect active HCMV infection or exposure to HCMV.
                                                                                 HCMV can cause opportunistic infections resulting in a variety of complications in, e.g. immunosuppressed patients. The IAP vaccines impart immunity to bone marrow transplant recipients, solid organ recipients, heart patients, AIDS patients or women of child-bearing years, without the need for ex vivo expansion of HCMV-specific cytotoxic T lymphocytes (which requires sophisticated laboratory setup and is highly labor-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New immunogenic peptides useful for providing immunity against cytomegalovirus (CMV) infections, are capable of eliciting cellular

Sequence 207115, Application US/10424599

Publication No. US20040031072A1

GENERAL INFORMATION:

APPLICANT: La Rosa Thomas J

APPLICANT: La Royald K

APPLICANT: Cao Yongwel

TITLE OF INVENTION: Soy Nucleic Acid Molecules and Other Molecules Associated With

TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement

TITLE REFERENCE: 38-21(53223)B

CURRENT APPLICATION NUMBER: US/10/424,599

CURRENT FILING DATE: 2003-04-28

NUMBER OF SEQ ID NOS: 285684

SEQ ID NO 207115
